CS 61A Discussion 3 Sequences and Data Abstraction

You know what it is

(a quiz)

Sequences

Sequences are ordered collections of items. Every sequence must have a **length** and allow for **element selection** (indexing).

Examples of Sequences

Lists

are sequences.

Sets

are **not** sequences.

Tuples

are sequences.

Dictionaries

are **not** sequences.

```
>>> len({1: 2, 2: 1})
2
>>> {1: 2, 2: 1}[0]
Error
```

Strings

are sequences.

```
>>> len('12')
2
>>> '12'[1]
'2'
```

List Manipulation

Creation

[7, 8] OR list((7, 8))

DO NOT call list on a non-iterable! list(7, 8) [1, [1], 'one', None, WILL error.

Population

You can put anything you want into a list.

True, (1,), 1.0, {1: 1}]

Concatenation

Glue multiple lists together with the + operator.

```
>>> [1, 2, 3] + ['four', {5}, (6,)]
[1, 2, 3, 'four', {5}, (6,)]
```

More List Manipulation

Existence Checking

Use the in operator.

```
>>> your_grades = ['a+', 'a-', 'a', 'a+']
>>> 'f' in your_grades
False
>>> 'a+' in your_grades
True
```

Length Practice

```
>>> len(([4, 5], 6, '7'))
>>> len(([1, 2, 3]))
>>> len('abc')
```

Length Practice (Solutions)

```
>>> len(([4, 5], 6, '7'))
3
>>> len(([1, 2, 3]))
3
>>> len('abc')
3
```

Indexing Practice

```
>>> naturals = list(range(5))
>>> naturals[1] = list(range(5))
>>> naturals
[0, [0, 1, 2, 3, 4], 2, 3, 4]
>>> naturals[-5] + naturals[4]
>>> naturals[1][1]
>>> naturals[-3][3]
>>> naturals[nns[-4][-4]][-4]
```

Indexing Practice (Solutions)

```
>>> naturals = list(range(5))
>>> naturals[1] = list(range(5))
>>> naturals
[0, [0, 1, 2, 3, 4], 2, 3, 4]
>>> naturals[-5] + naturals[4]
4
>>> naturals[1][1]
1
>>> naturals[-3][3]
Error
>>> naturals[nns[-4][-4]][-4]
1
```

List Slicing

Get a **new list** whose elements are some subset of the original list. Slicing involves three arguments, all of which are optional:

```
lst[start index : end index ± 1 : step size]
```

- If step size is omitted, it defaults to 1.
- If start index is omitted, it defaults to 0 if step size > 0,
 and len(lst) 1 if step size < 0.
- If end index is omitted, it defaults to len(lst) 1 if step size > 0, and 0 if step size < 0.
- It'll be end index + 1 if step size > 0, and end index 1 if step size < 0.

Slicing Practice

```
>>> naturals = [list(range(4)), 4, 5]
>>> orig = naturals[:]
>>> naturals[0][2], naturals[-2] = 50, 6
>>> naturals
[[0, 1, 50, 3], 6, 5]
>>> orig
>>> naturals[1::-1]
>>> naturals[:2]
>>> naturals[:-3:-1]
>>> naturals[:2:3]
>>> naturals[0][::-1][1:5:2]
```

Slicing Practice (Solutions)

```
>>> naturals = [list(range(4)), 4, 5]
>>> orig = naturals[:]
>>> naturals[0][2], naturals[-2] = 50, 6
>>> naturals
[[0, 1, 50, 3], 6, 5]
>>> orig
[[0, 1, 50, 3], 4, 5]
>>> naturals[1::-1]
[6, [0, 1, 50, 3]]
>>> naturals[:2]
[[0, 1, 50, 3], 6]
>>> naturals[:-3:-1]
Γ5, 6 ]
>>> naturals[:2:3]
[[0, 1, 50, 3]]
>>> naturals[0][::-1][1:5:2]
[50, 0]
```

List Processing Functions

- map(fn, lst)
 - Returns an iterator over the elements of 1st, where fn has been applied to all of them.
 - list(map(lambda x: $x * 2, [1, 2, 3])) \rightarrow [2, 4, 6]$
- filter(pred, lst)
 - Returns an iterator over the elements of 1st for which pred(<elt>) is a true value.
 - list(filter(lambda x: x % 2, [1, 2, 3])) \rightarrow [1, 3]
- reduce(accum, lst, zero_value)
 - Repeatedly combines elements of 1st into one value (using the accum function), starting with the base value zero_value.
 - In Python 3, you'll need to import reduce from functools.
 - reduce(lambda x, y: x + y, [1, 2, 3]) \rightarrow 6

List Comprehensions

A more concise way to create a new list.

```
lst = [<expr> for x in <iterable> if <cond expr>]
-is equivalent to -
lst = []
for x in <iterable>:
    if <cond expr>:
        lst += [<expr>]
```

Abstract Data Types

66

"I don't care how it's implemented. I just want to know what properties and/or behavior the data has" -Abraham Lincoln

Only the constructors and the selectors should know how the data is really represented!

Everything else should just reference the constructors / selectors themselves.

(Then, if you change the constructor / selector implementation, nothing else should break.)

What color are her eyes? What is the mustache made of?

How many slices of pizza are there? Is this a vegetarian pizza?

DEMO

Is this location good for a tan?

Visual Question Answering

That's it for today! See you around.:)
